

Building a U-shaped mask profile

Reproduce a flared mask with a rounded (U) opening bottom using the material stack and per-layer shape treatments.

Steps

1. **Material stack** (row 1 = top). Add **indigo** 200 nm, then **lavender** 55 nm.
2. **Base feature**. Pitch **210**, Space **95**, Opening depth **200**, Top vacuum **25**.
3. **Opening bottom round**: **47** nm (about half of Space) — this makes the U-shaped bottom.
4. **Shape the mask**. On the indigo layer press its **shape** button and add **Round** radius **75** for the flared top.
5. The preview updates live as you edit — click **Save .bmp...** to export the image.

How the shape treatments work

- **Round** softens the top corner, **Taper** slopes the whole wall, and **Opening bottom round** curves the base — each shapes a different part.
- **Taper** angle is the sidewall angle from the horizontal base: **90° = vertical**, smaller = more sloped. (Not needed for this mask.)
- You can **stack several treatments** on one layer — e.g. **Round + Taper**. Use **+ Add another treatment** in the shape dialog. They combine and are order-independent.

Tips

- The shape button on a layer row is enabled only for layers the opening actually reaches.
- Toolbar Save stores the whole project; Save .bmp exports just the picture.
- Add your own colors with the “+ New material (color)” button.
- Use  Measure in the preview to read any dimension in nm;  Polygons... exports editable SVG/JSON.
